

AI-Powered Zero-Day Attack Detection Platform — Evaluation Report

Generated 2026-08-28 00:25

1. Dataset Overview

Dataset: Rehearsal NSL-KDD Demo Matrix

Known classes (used for training): benign, probe, r2l, u2r

Unknown / held-out classes (zero-day simulation): dos

2. Model Comparison

All models were trained on identical known-class splits and evaluated with the same held-out unknown classes to ensure a fair comparison.

Model	Acc.	Prec.	Recall	F1	MCC	ROC-AUC	FPR	Unk. Recall	Train (s)	Infer (ms)
cnn	0.400	0.100	0.250	0.143	0.000	0.562	0.000	1.000	0.1	2.21

3. Key Finding

cnn achieved the highest unknown-attack recall (1.000), making it the strongest candidate for zero-day detection among the architectures compared.
